**PRESS RELEASE
FOR IMMEDIATE RELEASE**

**YORBEAU ISSUES A CORRECTION TO ITS PRESS RELEASE
OF FEBRUARY 28, 2014**

Montréal, March 3, 2014 - A correction from source is being issued with respect to the press release of Yorbeau Resources Inc. that was disseminated on February 28, 2014 at 1:12 pm ET.

Under “Program Highlights” and “Cinderella East Results” of the original release, the drilling result of hole CI-13-620 was reported as “13.0 g/t Au over 5.4 metres” and should read “5.4 g/t Au over 13.0 metres”.

The following is a complete and corrected version of the press release.

Yorbeau Resources Inc. (TSX: YRB.A) (the “Company” or “Yorbeau”) is pleased to provide an update on the results of the diamond drilling program carried out in 2013 by Gold Fields Sudbury Exploration Corp. (“Gold Fields”) on the Company’s Rouyn property.

The 2013 program represented the first phase of a \$4M exploration commitment made by Gold Fields pursuant to the option and joint venture agreement entered into between Gold Fields and the Company. The 2014 exploration program which is currently under way is budgeted at \$2.2M and will consist of approximately 14,000 metres, mostly targeting either the extension at depth of known gold mineralization or potential new zones in the eastern half of the property.

The 2013 drilling program totalled 7,808 metres in 26 drill holes located in the Cinderella, Augmitto and Gamble Lake blocks (see the attached location map). The objective at Cinderella was to check for possible expansion of the known mineralization at depths shallower than 400 metres. Most of the drilling involved stepping out from existing zones. At Augmitto, the objectives were to confirm near surface mineralization below historical exploration trenches and test the potential effect of using different drilling orientations. Finally, at Gamble Lake, the objective was to confirm mineralization in a new sector developing at depth in the west boundary of the Gamble Lake zone.

PROGRAM HIGHLIGHTS

Highlights of the 2013 program are shown below:

- Hole CI-13-616: **6.6 g/t Au over 9.0 metres** (in the Footwall Zone)
- including **27.1 g/t Au over 1.0 metres**
- Hole CI-13-620: **5.4 g/t Au over 13.0 metres**
- including **42.4 g/t Au over 1.0 metres**
- Hole AUG-13-625: **11.4 g/t Au over 5.3 metres**
- including **16.6 g/t Au over 3.0 metres**

- Hole AUG-13-627: **7.9 g/t Au** over **7.0 metres**
- Hole GA-13-628: **6.0 g/t Au** over **11.3 metres** at depth at Lac Gamble Zone
- including **30.4 g/t Au** over **1.0 metres**

Cinderella Area

A series of 18 holes totalling 5,350 metres was drilled to explore the top 400 metres of the Cinderella Zone, including 7 holes (1,633 m) testing near surface mineralization in the eastern portion of Cinderella. All holes intersected the favourable carbonatized Piché ultramafics, many of which containing visible gold. Significant assay results are shown below:

Hole	from	to	Au (g/t)	Core length (m)	Remarks
CI-13-603	132.8	133.9	1.5	1.1	Piché
CI-13-604	348.9	355.0	1.2	6.1	Piché
	368.4	370.7	1.8	2.3	Piché
	472.4	479.9	0.9	7.4	Footwall
CI-13-605	203.3	207.5	1.4	4.2	Piché
CI-13-606	211.0	213.3	1.4	2.3	Piché
	330.0	332.0	1.0	2.0	Footwall
	336.0	337.3	1.3	1.3	Footwall
CI-13-607	No significant values				
CI-13-608	104.4	106.7	0.6	2.3	Piché
	215.0	216.0	1.3	1.0	Footwall
CI-13-609	266.0	267.0	1.6	1.0	Piché
	358.2	368.2	1.6	10.0	Footwall Zone VG
CI-13-610	310.4	314.0	3.9	3.6	Footwall Zone VG
CI-13-611	258.1	270.4	1.0	12.3	Piché , VG+

Hole	from	to	Au (g/t)	Core length (m)	Remarks
CI-13-612	Abandoned due to deviation				
CI-13-613	267.1	271.1	1.8	4.0	Piché
	308.0	311.0	1.2	3.0	Piché , VG
	335.0	336.0	3.3	1.0	Piché , VG

Although true width of the mineralized zones cannot be established with accuracy given the large spacing between holes, it is estimated that it may represent about 70% of core length.

While anomalous values were obtained around the previously known mineralized zones at Cinderella, the drilling did not lead to an expansion of the zones. However, the drilling to test near surface mineralization in the eastern portion of Cinderella returned several high grade assays in the vicinity of historical holes 05-S-390 et 05-S-397 which had returned respectively 24.1 g/t Au over 1.5 m and 1.9 g/t Au over 7.1 m. Significant results of the 2013 drilling are shown below.

Cinderella East Results

Hole	from	to	Au (g/t)	Core length (m)	Remarks
CI-13-614	48.9	50.0	6.6	1.2	Piché, VG
	75.0	76.0	12.3	1.0	Piché, VG
	121.8	122.8	1.1	1.0	Footwall Zone
CI-13-615	22.0	26.7	0.6	4.7	Hanging wall
	53.0	57.0	1.1	4.0	Piché, VG
	150.0	151.0	1.0	1.0	Footwall
CI-13-616	341.0	342.0	0.8	1.0	Piché
	423.0	432.0	6.6	9.0	Footwal Zone, VG+++
	including				
	424.0	425.0	27.1	1.0	
CI-13-617	97.0	99.0	0.5	2.0	Piché
	171.0	172.0	1.4	1.0	Footwall Zone VG
CI-13-618	213.0	216.0	2.0	3.0	Footwall Zone
CI-13-619	190.5	193.5	0.6	3.0	Footwall Zone VG
	206.5	212.0	2.4	5.5	Footwall Zone VG

Hole	from	to	Au (g/t)	Core length (m)	Remarks
	including				
	207.5	208.5	7.9	1.0	
CI-13-620	61.0	74.0	5.4	13.0	Piché VG+
	including				
	65.4	66.4	42.4	1.0	
	74.0	75.0	21.1	1.0	
	123.9	124.9	1.4	1.0	Footwall Zone

Although true width of the mineralized zones cannot be established with accuracy given the large spacing between holes, it is estimated that it may represent about 70% of core length.

Lac Gamble

At Gamble Lake the objective was to confirm mineralization in a new sector developing at depth near the west boundary of the Gamble Lake zone. This new interesting sector, discovered by Yorbeau with hole 12-GA-593 drilled in late 2012, had intersected 3.7 g/t Au over a core length of 15 metres (press release of December 6, 2012). In 2013, 3 holes totaling 1,168 metres were drilled to follow up on this while hole GA-13-621 (387 m) was drilled in a wide gap between the Cinderella and Gamble Lake zones. Hole GA-13-622 had to be abandoned for excessive deviation. Significant assay results are shown below.

Hole	from	to	Au (g/t)	Core length (m)	Remarks
GA-13-621	287.4	290.4	1.5	3.0	Piché, west of Gamble Lake zone
	353.0	354.0	0.5	1.0	Footwall Zone, VG
GA-13-622	Abandoned due to deviation				
GA-13-623	491.0	500.0	0.5	9.0	Piché, VG
GA-13-628	495.7	507.0	6.0	11.3	Piché, VG++++
	including				
	497.8	498.8	30.4	1.0	
	503.0	504.0	22.6	1.0	

Although true width of the mineralized zones cannot be established with accuracy given the large spacing between holes, it is estimated that it may represent about 70% of core length.

Results obtained in hole GA-13-628 are considered most encouraging as they support the hypothesis that the Gamble Lake zone remains open to the west at depth. Further drilling by Gold Fields is planned in this sector (press release of January 30, 2014).

Augmitto

During the summer 2013, historical trench #4 was cleaned up and extended to the east in order to observe the Augmitto mineralized zone in the vicinity of drill hole 07-S-442 which had returned a grade of 11.3 g/t Au over a core length of 8.5 m. After detailed mapping of the gold bearing veins and structures at surface, a drill program was carried out with the objectives of confirming near surface mineralization below historical exploration trenches and also to test the potential effect of using different drilling orientations. Significant assay results are shown below.

Hole	from	to	Au (g/t)	Core length (m)	Remarks
AUG-13-624	49.0	57.0	2.7	8.0	Piché, VG++
	69.3	78.0	1.7	8.7	Piché
AUG-13-625	55.7	67.1	11.4	5.3	Piché, VG++
	including				
	57.0	58.0	9.2	1.0	
	58.0	59.0	13.3	1.0	
	59.0	60.0	27.2	1.0	
	85.2	93.2	1.1	7.0	Piché
AUG-13-626	92.0	94.0	1.4	2.0	Piché
	105.0	126.0	2.1	21.0	Piché, VG
	including				
	112.0	116.0	4.1	4.0	
	120.0	122.0	6.9	2.0	
AUG-13-627	9.8	21.3	2.9	11.5	Piché
	32.0	39.0	7.9	7.0	Piché, VG++
	including				
	35.0	36.0	16.1	1.0	
	37.0	38.0	18.4	1.0	

During mapping of the trench and detailed core logging, it appeared that two main sets of quartz veins stand out by their abundance of visible gold and the majority of the high grade assays in the above drilling are associated with these two sets. Because of the various drilling orientations designed to better intersect specific vein orientations, the true widths of the above mineralized envelopes may range widely between 25 and 45 % of the measured core lengths. In general, the 2013 drilling below the Augmitto trenches

confirmed the previous assay results. With respect to the potential effect of using different drilling orientations, the results are still being evaluated. However, at this time it does not seem warranted to modify the drilling strategy while testing the mineralized envelopes within the Piché formation.

“We are pleased with the drilling results obtained in 2013 and in particular with Gold Fields’ strategy focused on diamond drilling. Yorbeau’s Rouyn property encloses an impressive number of gold intersections over a very large area and, consequently, a very significant amount of drilling remains to be done in order to unlock the full value of the Rouyn property. Yorbeau’s association with Gold Fields is a major step in realizing the required drilling. We remain confident that we are working on a significant gold deposit that ultimately may have to be proved up by underground exploration” says President and CEO David Crevier.

The qualified person under National Instrument 43-101 is Laurent Hallé, P.Geo., who has reviewed and approved the content of this release.

Samples are analyzed at ALS Chemex Laboratories in Val d’Or, Quebec and the sampling and assaying program is subjected to Gold Fields’ extensive QA/QC program that includes inserting blanks and gold standards in batch samples being sent to the assay laboratory. Samples that contain visible gold are subjected to a strict sampling and assay protocol designed specifically to deal with coarse particle gold.

Gold Fields Sudbury is a wholly-owned subsidiary of Gold Fields Limited, an unhedged, globally diversified producer of gold with eight operating mines in Australia, Ghana, Peru and South Africa. In February 2013 Gold Fields unbundled its KDC and Beatrix mines in South Africa into an independent and separately listed company, Sibanye Gold. In October 2013 Gold Fields acquired Barrick Gold's Granny Smith, Lawlers and Darlot Gold Mines in Western Australia. Gold Fields subsequently has attributable annual production of approximately 2.2 million ounces of gold, managed gold Mineral Reserves of approximately 59 million ounces and managed gold Mineral Resources of approximately 137 million ounces. Gold Fields has a primary listing on the JSE Limited, with secondary listings on the New York Stock Exchange (NYSE), NASDAQ Dubai Limited, Euronext in Brussels (NYX) and the Swiss Exchange (SWX).

About Yorbeau Resources Inc.

The Company’s 100% controlled Rouyn Property contains four known gold deposits in the 6-km-long Augmitto-Astoria corridor situated on the western half of the property. Two of the four deposits, Astoria and Augmitto, have substantial underground infrastructure and have been the focus of NI 43-101 technical reports.

A recently completed comprehensive report on the Company may be found on the Company’s new website at www.yorbeauresources.com. The raison d’être of Yorbeau is to identify a world class gold deposit in a major mining camp.
